

Reflection on Assignment 2 – Overview of ICT Jobs

The online talk from CLARITY TECHWORKS SDN BHD on 14/11/2023 was interesting. The speakers were friendly, and they gave us a deep dive into different jobs in the tech world. This talk was especially useful for us first-year students.

We got to know about different cool jobs like Android Developer, UI/UX Designer, QA Testing, API Developer, and Web Developer. Android Developers make apps for Android using languages like Java or Kotlin. They build, test, and take care of mobile apps. UI/UX Designers focus on making software look good and easy to use. They create interfaces that are nice to look at and make software user-friendly. QA Testing is all about making sure software works perfectly by finding and fixing any mistakes or bugs. API Developers help different software systems talk to each other smoothly by creating APIs. And Web Developers are like architects for websites, using languages like HTML, CSS, and JavaScript.

I thought the talk was awesome, and I can't think of any ways to make it better. It's like a super helpful guide for students who want to understand tech jobs. The speakers were interesting, and they explained different tech jobs well. This was perfect for us first-year students because it made understanding these jobs easy.

The talk gave us a clear picture of what each job does and lots of advice. It's like a roadmap for us to understand the tech industry better. We learned how important each job is and how they all work together. It's like a big puzzle coming together to make awesome tech stuff. This talk was a goldmine of information, setting us up with a solid foundation as we start our tech journey in college.
